

The physics maps already encode the source location

unsupervised UMAP of the 2,000 per-scenario source-evidence maps (model input, measured wind only) — no network involved; the same embedding coloured three ways

A. True source easting

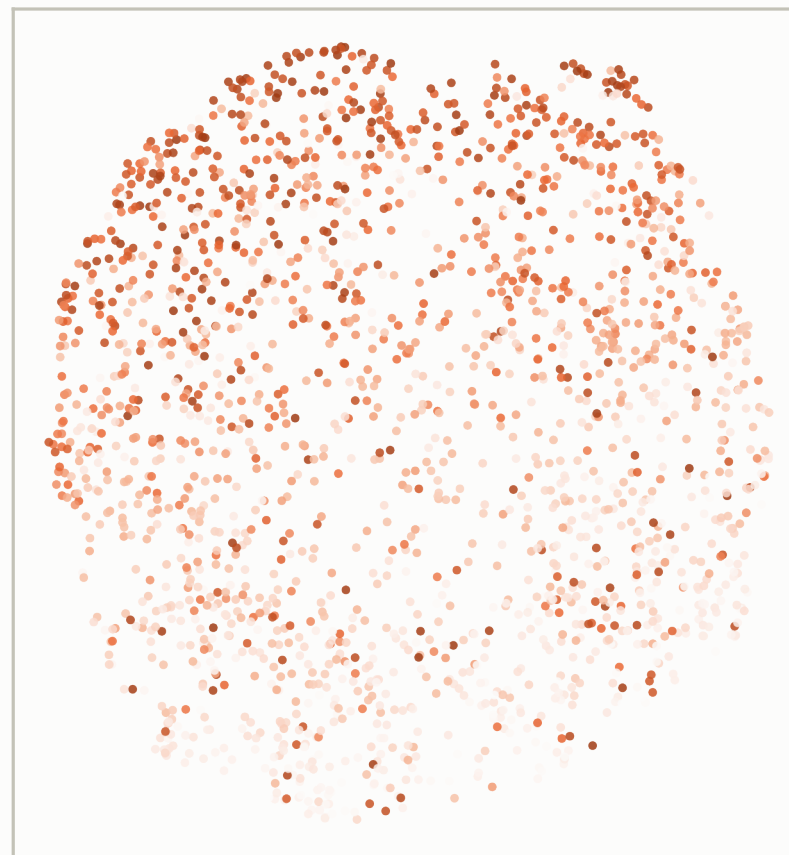

100 150 200 250 300 350 400

source x on the site (m)

one embedding axis recovers east-west

B. True source northing

100 150 200 250 300 350 400

source y on the site (m)

the other axis recovers north-south

C. Achieved region radius

50 100 200

90% region radius (m), log

neighbours tend to share difficulty (rank corr. 0.33)
