

Through the model's eyes: eight plausible winds, one answer

the anemometer's stated error means the measured wind could have been any of these — the pipeline recomputes the plume evidence under eight wind draws and the network sees only their consensus and disagreement (same scenario as the feature-map gallery, 8 masts, 92 kg h⁻¹; identical RNG streams to the frozen dataset)

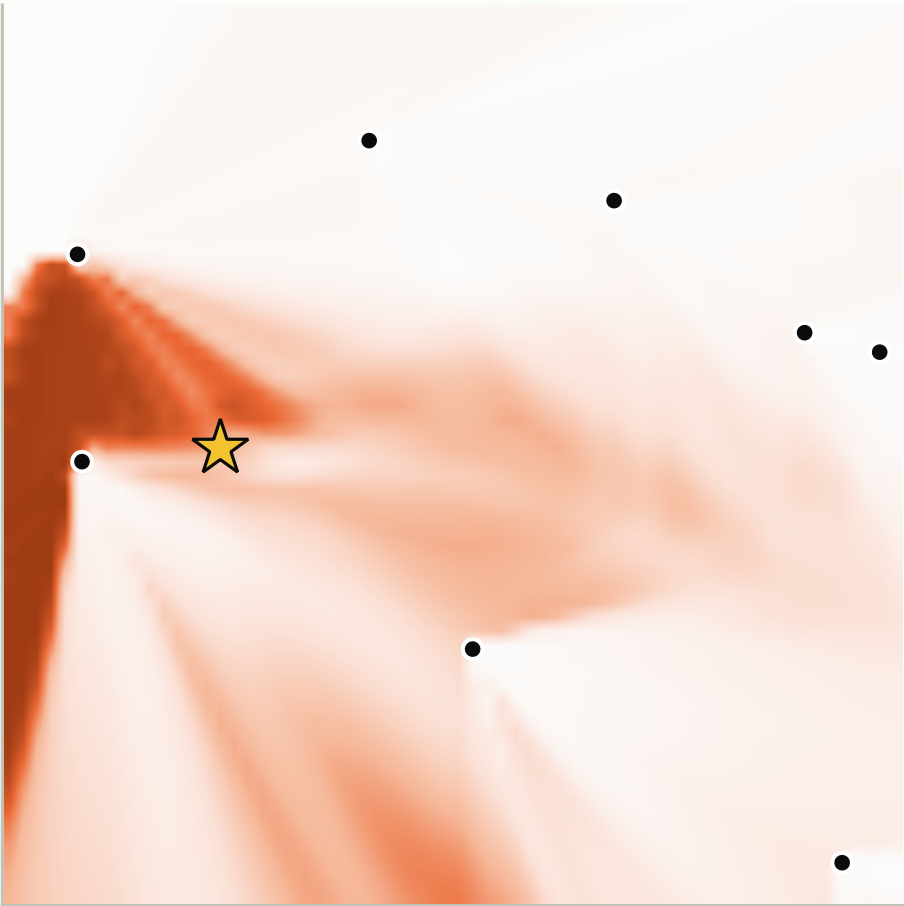

A. Consensus of the eight draws

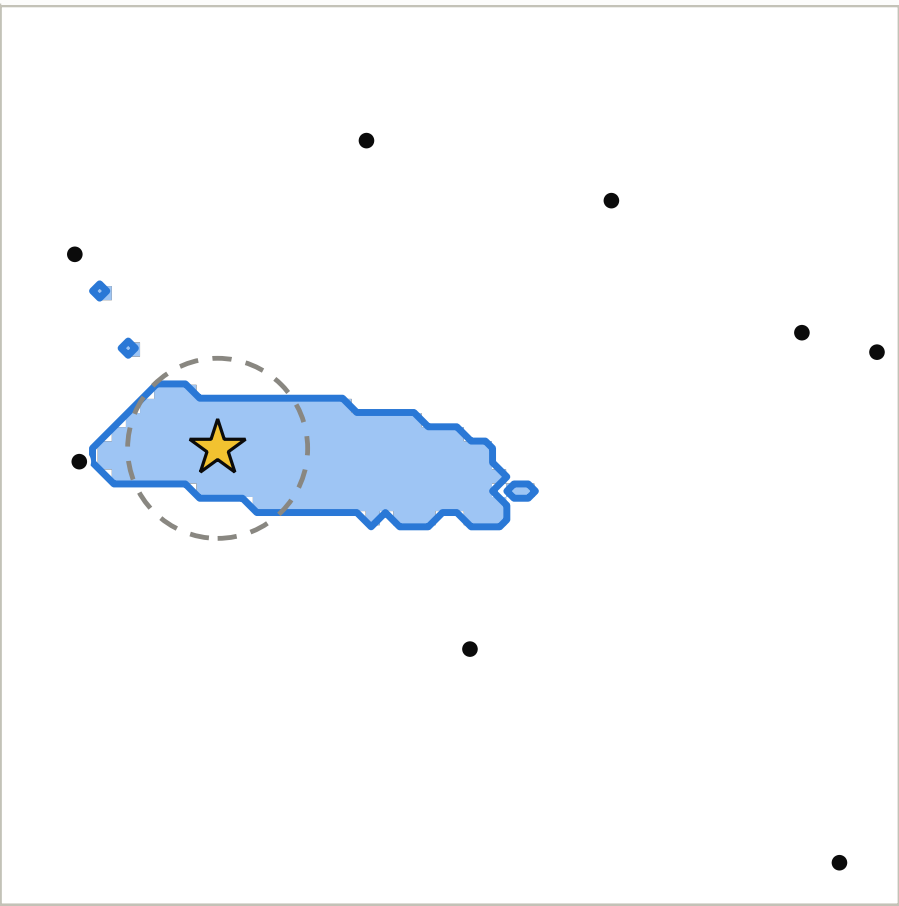

mean evidence over the draws — input channel 1,
matches the frozen input maps to 10⁻⁶

B. Where the draws disagree

spread across the draws — input channel 2,
the wind-sensitivity map

C. The model's answer

conformal region of the physics-guided model:
radius 62 m at 90% coverage

● sensor masts (8) ★ true methane source — physics-guided 90% region - - - 50 m facility scale
