

What the set network learned: embedding of all 2,000 test scenarios

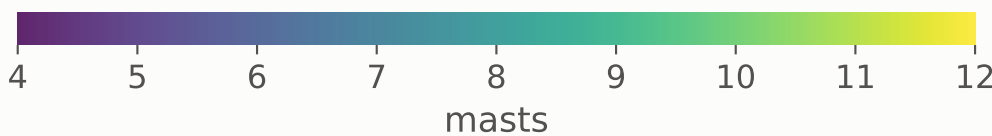

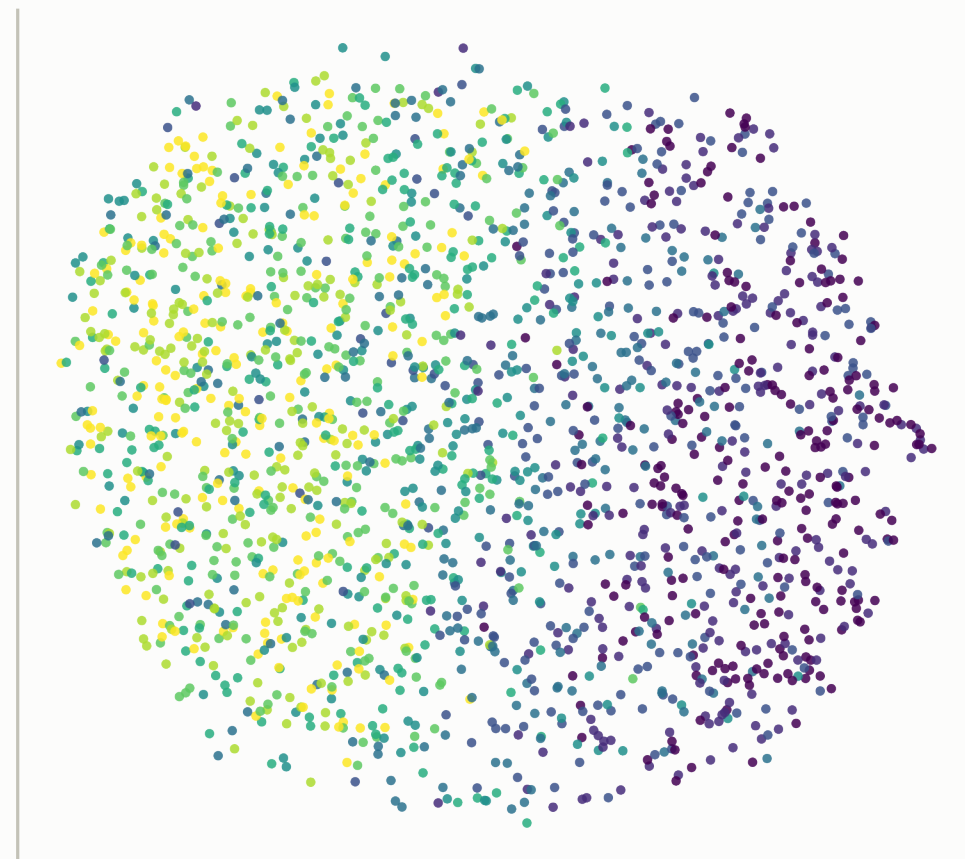

UMAP of the decoder-input embedding (mean-pool $\oplus$ max-pool $\oplus$ context), physics-guided DeepSets (ensr, seed 1) — silhouette of radius split 0.03;

Spearman(axis 1): log radius +0.26, masts -0.79, log radius within a mast count +0.06 — the layout tracks network size (an input), not difficulty per se

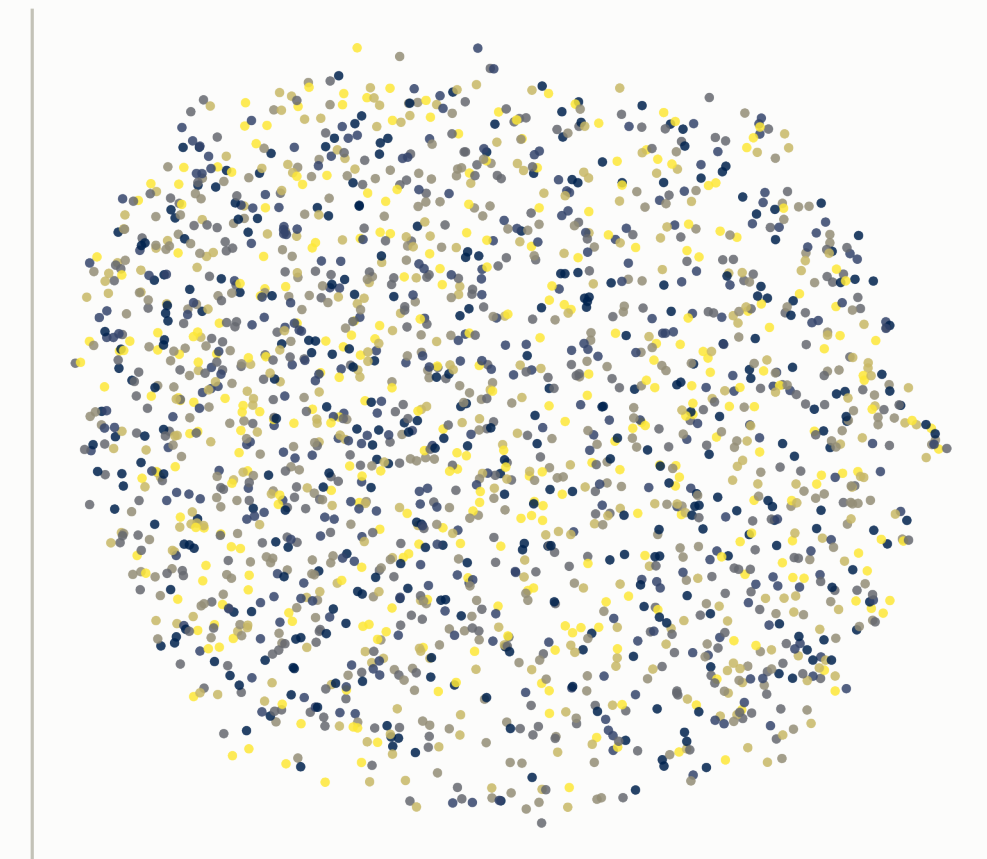

A. 90% region radius

B. Number of masts

C. Stability class
